

Long and Triple Jump Distance Indicator

AT100

The jump distance indicator consists of a metal supporting structure with four slots that fit white plates, made of 3mm thick rigid PVC foam, on which are indicated the reference numbers for the long jump on one side and the triple jump on the opposite side. Vertical metal bars between the numbered plates indicate the distance at intervals of 20 cm.

After a degreasing treatment, consisting of a pressured phosphate bath, the structure is painted with polyester powder paint and polymerized at 200° C in an oven.
